

Integrated Radio & Camera Control Solution developed by DCRS & Synectics

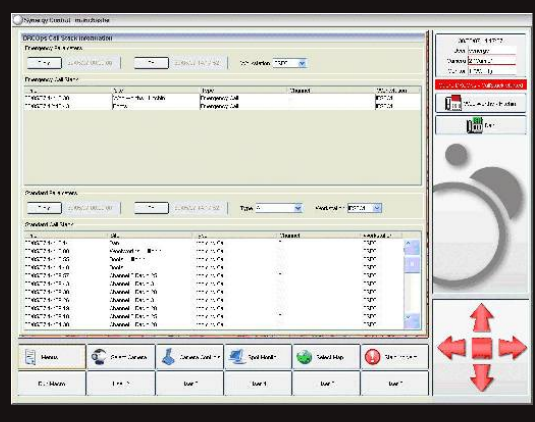

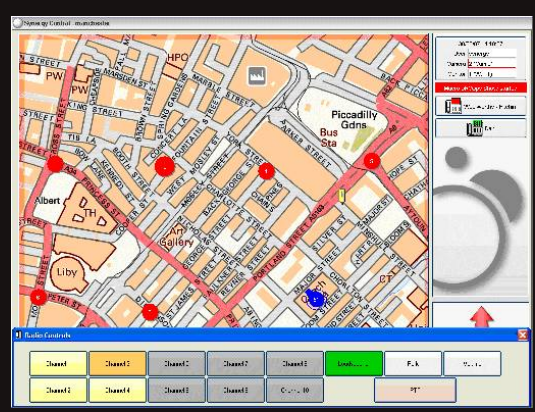

Town Centre Radio Solutions

Operating in conjunction with DRCOps radio switching system SynergyRadio™ enables the broadcasting radio's unique descriptive identifier to be displayed in the Synergy Event Pane. This is updated for every radio and channel that has been selected for monitoring by the operator, allowing them to provide accurate information on the radios expected location.

Further operator selectable, is the association of a CCTV camera to a specific broadcasting radio. Should the operator wish to view an associated camera, selecting the event pane radio button will automatically switch the camera nearest to the radio user to the operators spot monitor and a preset home position. This increases operator effectiveness by allowing instant visualisation of a radio operator's situation.

Synergy logs all radio activity, which can then be passed to a specific workstation and is then filtered by call type for immediate analysis, with the addition of emergency radio calls represented as additional events.

Full control of advanced radio channel setup and selection is available from the DRCOps control panel, instantly accessible via a single on-screen button.

Key features:

- | Unique text identifier for each broadcasting radio
- | Icon to identify broadcasting radio channel status
- | Camera switching from radio identifier
- | Additional identifier for Emergency broadcast
- | Programmable reaction to broadcast selection
- | Full audit trail for all radio broadcasts
- | Integration and concurrent display of DCRS software
- | Control of DCRS software
